(54) Title: HETEROAROMATIC GLUCOKINASE ACTIVATORS

(57) **Abstract:** The present invention describes 2,3-di-substituted N-heteroaromatic propionamides, of Formula (I) wherein the substitution at the 3-position is an optionally substituted phenyl ring and the substitution at the 2-position is an alkyl or cycloalkyl group; pharmaceutical compositions comprising the same; and, methods of using the same. The propionamides are glucokinase activators for the treatment of type II diabetes.

HETEROAROMATIC GLUCOKINASE ACTIVATORS

FIELD OF THE INVENTION

[0001] The present invention relates to 2,3-di-substituted N-heteroaromatic propi-

5 onamides, pharmaceutical compositions comprising the same, and methods of us-
ing the same. The propionamides are useful as glucokinase activators which in-
crease insulin secretion in the treatment of type II diabetes.

BACKGROUND OF THE INVENTION

10 [0002] Glucokinase (GK) is one of four hexokinases that are found in mammals
[Colowick, S. P., in *The Enzymes*, Vol. 9 (P. Boyer, ed.) Academic Press, New
York, N.Y., pages 1-48, 1973]. The hexokinases catalyze the first step in the me-
tabolism of glucose, i.e., the conversion of glucose to glucose-6-phosphate. Glu-
cokinase has a limited cellular distribution, being found principally in pancreatic β -
15 cells and liver parenchymal cells. In addition, GK is a rate-controlling enzyme for
glucose metabolism in these two cell types that are known to play critical roles in
whole-body glucose homeostasis [Chipkin, S. R., Kelly, K. L., and Ruderman, N. B.
in *Joslin's Diabetes* (C. R. Khan and G. C. Wier, eds.), Lea and Febiger, Philadel-
phia, Pa., pages 97-115, 1994]. The concentration of glucose at which GK demon-
20 strates half-maximal activity is approximately 8 mM. The other three hexokinases
are saturated with glucose at much lower concentrations (<1 mM). Therefore, the
flux of glucose through the GK pathway rises as the concentration of glucose in the
blood increases from fasting (5 mM) to postprandial (\approx 10-15 mM) levels following a
carbohydrate-containing meal [Printz, R. G., Magnuson, M. A., and Granner, D. K.
25 in *Ann. Rev. Nutrition* Vol. 13 (R. E. Olson, D. M. Bier, and D. B. McCormick, eds.),
Annual Review, Inc., Palo Alto, Calif., pages 463-496, 1993]. These findings con-
tributed over a decade ago to the hypothesis that GK functions as a glucose sensor
in β -cells and hepatocytes (Meglasson, M. D. and Matschinsky, F. M. *Amer. J.*
Physiol. 246, E1-E13, 1984). In recent years, studies in transgenic animals have
30 confirmed that GK does indeed play a critical role in whole-body glucose homeosta-

sis. Animals that do not express GK die within days of birth with severe diabetes while animals overexpressing GK have improved glucose tolerance (Grupe, A., Hultgren, B., Ryan, A. et al., *Cell* 83, 69-78, 1995; Ferrie, T., Riu, E., Bosch, F. et al., *FASEB J.*, 10, 1213-1218, 1996). An increase in glucose exposure is coupled 5 through GK in β -cells to increased insulin secretion and in hepatocytes to increased glycogen deposition and perhaps decreased glucose production.

[0003] The finding that type II maturity-onset diabetes of the young (MODY-2) is caused by loss of function mutations in the GK gene suggests that GK also functions as a glucose sensor in humans (Liang, Y., Kesavan, P., Wang, L. et al., *Biochem. J.* 309, 167-173, 1995). Additional evidence supporting an important role for GK in the regulation of glucose metabolism in humans was provided by the identification of patients that express a mutant form of GK with increased enzymatic activity. These patients exhibit a fasting hypoglycemia associated with an inappropriately 10 elevated level of plasma insulin (Glaser, B., Kesavan, P., Heyman, M. et al., *New England J. Med.* 338, 226-230, 1998). While mutations of the GK gene are not found in the majority of patients with type II diabetes, compounds that activate GK and, thereby, increase the sensitivity of the GK sensor system will still be useful in the treatment of the hyperglycemia characteristic of all type II diabetes. Glu- 15 cokinase activators will increase the flux of glucose metabolism in β -cells and hepatocytes, which will be coupled to increased insulin secretion. Such agents would be useful for treating type II diabetes. Several GK activators are known, see, for example, US 2004/0014968 (Hofmann-La Roche Inc.) and WO 2004/002481 (Novo Nordisk A/S)

[00109] In another embodiment the analogue is an analogue wherein position B3 is Lys and position B29 is Glu or Asp.

[00110] In another embodiment the GLP-1 derivative to be employed in combination with a compound of the present invention refers to GLP-1(1-37), exendin-4(1-39), insulinotropic fragments thereof, insulinotropic analogues thereof and insulinotropic derivatives thereof. Insulinotropic fragments of GLP-1(1-37) are insulinotropic peptides for which the entire sequence can be found in the sequence of GLP-1(1-37)

and where at least one terminal amino acid has been deleted. Examples of insulinotropic fragments of GLP-1(1-37) are GLP-1(7-37) wherein the amino acid residues in positions 1-6 of GLP-1(1-37) have been deleted, and GLP-1(7-36) where the amino acid residues in position 1-6 and 37 of GLP-1(1-37) have been deleted.

- 5 Examples of insulinotropic fragments of exendin-4(1-39) are exendin-4(1-38) and exendin-4(1-31). The insulinotropic property of a compound may be determined by in vivo or in vitro assays well known in the art. For instance, the compound may be administered to an animal and monitoring the insulin concentration over time. Insulinotropic analogues of GLP-1(1-37) and exendin-4(1-39) refer to the respective
- 10 molecules wherein one or more of the amino acids residues have been exchanged with other amino acid residues and/or from which one or more amino acid residues have been deleted and/or from which one or more amino acid residues have been added with the proviso that said analogue either is insulinotropic or is a prodrug of an insulinotropic compound. Examples of insulinotropic analogues of GLP-1(1-37)
- 15 are e.g. Met⁸-GLP-1(7-37) wherein the alanine in position 8 has been replaced by methionine and the amino acid residues in position 1 to 6 have been deleted, and Arg³⁴-GLP-1(7-37) wherein the valine in position 34 has been replaced with arginine and the amino acid residues in position 1 to 6 have been deleted. - 20 wherein the amino acid residues in position 2 and 3 have been replaced with serine and aspartic acid, respectively (this particular analogue also being known in the art as exendin-3). Insulinotropic derivatives of GLP-1(1-37), exendin-4(1-39) and analogues thereof are what the person skilled in the art considers to be derivatives of these peptides, i.e., having at least one substituent which is not present in the parent peptide molecule with the proviso that said derivative either is insulinotropic or is a prodrug of an insulinotropic compound. Examples of substituents are amides, carbohydrates, alkyl groups and lipophilic substituents. UTILITY

[00152] Glucokinase Activity Assay (I)

[00153] Glucokinase activity is assayed spectrometrically coupled to glucose 6-phosphate dehydrogenase to determine compound activation of glucokinase. The

5 final assay contains 50 mM Hepes, pH 7.1, 50 mM KCl, 5 mM MgCl₂, 2 mM dithio-threitol, 0.6 mM NADP, 1 mM ATP, 0.195 μ M G-6-P dehydrogenase (from Roche, 127 671), and 15 nM recombinant human glucokinase. The glucokinase is human liver glucokinase N-terminally truncated with an N-terminal His-tag ((His)₈-VEQILA.....Q466) and is expressed in E.coli as a soluble protein with enzymatic

10 activity comparable to liver extracted GK.

[00154] The purification of His-tagged human glucokinase (hGK) was performed as follows: The cell pellet from 50 mL E. coli culture was resuspended in 5 mL extraction buffer A (25 mM HEPES, pH 8.0, 1 mM MgCl₂, 150 mM NaCl, 2 mM mercaptoethanol) with the addition of 0.25 mg/mL lysozyme and 50 μ g/mL sodium azide.

15 After 5 minutes at room temperature, 5 mL of extraction buffer B (1.5 M NaCl, 100 mM CaCl₂, 100 mM MgCl₂, 0.02 mg/mL DNase 1, protease inhibitor tablet (Complete® 1697498): 1 tablet pr. 20 mL buffer) was added. The extract was then centrifuged at 15.000 g for 30 minutes. The resulting supernatant was loaded on a 1 mL Metal Chelate Affinity Chromatography (MCAC) Column charged with Ni²⁺. The 20 column was washed with 2 volumes buffer A containing 20 mM imidazole and the bound his-tagged hGK was subsequently eluted using a 20 minute gradient of 20 to 500 mM imidazole in buffer A. Fractions were examined using SDS-gel-electrophoresis, and fractions containing hGK (MW: 52 KDa) were pooled. Finally a gelfiltration step was used for final polishing and buffer exchange. hGK containing 25 fractions were loaded onto a Superdex® 75 (16/60) gelfiltration column and eluted with Buffer B (25 mM HEPES, pH 8.0, 1 mM MgCl₂, 150 mM NaCl, 1 mM Dithio-threitol). The purified hGK was examined by SDS-gel electrophoresis and MALDI mass spectrometry and finally 20% glycerol was added before freezing. The yield from 50 mL E. coli culture was generally approximately 2-3 mg hGK with a purity

30 >90%.

[00155] The compound to be tested was added into the well in final 2.5% DMSO concentration in an amount sufficient to give a desired concentration of compound, for instance 1, 5, 10, 25 or 50 μ M. The reaction started after glucose was added to a final concentration of 2, 5, 10 or 15 mM. The assay used a 96-well UV plate and

5 the final assay volume used was 200 μ l/well. The plate was incubated at 25°C for 5 min and kinetics was measured at 340 nm in SpectraMax® every 30 seconds for 5 minutes. Results for each compound were expressed as the fold activation of the glucokinase activity compared to the activation of the glucokinase enzyme in an assay without compound after having been subtracted from a "blank", which is without 10 glucokinase enzyme and without compound. The compounds in each of the Examples exhibited activation of glucokinase in this assay. A compound, which at a concentration of at or below 30 μ M gives 1.5 - fold higher glucokinase activity than the result from the assay without compound, was deemed to be an activator of glucokinase.

15 [00156] The glucose sensitivity of the compounds was measured at a compound concentration of 10 μ M and at glucose concentrations of 5 and 15 mM.

[00157] Glucokinase Activity Assay (II)

[00158] Determination of glycogen deposition in isolated rat hepatocytes:

20 [00159] Hepatocytes were isolated from rats fed *ad libitum* by a two-step perfusion technique. Cell viability, assessed by trypan blue exclusion, was consistently greater than 80%. Cells were plated onto collagen-coated 96-well plates in basal medium (Medium 199 (5.5 mM glucose) supplemented with 0.1 μ M dexamethasone, 100 units/mL penicillin, 100 mg/mL streptomycin, 2 mM L-glutamine 25 and 1 nM insulin with 4 % FCS at a cell density of 30,000 cells/well. The medium was replaced with basal medium 1 hour after initial plating in order to remove dead cells. Medium was changed after 24 hours to basal medium supplemented with 9.5 mM glucose and 10 nM insulin to induce glycogen synthesis, and experiments were performed the next day. The hepatocytes were washed twice with prewarmed 30 (37°C) buffer A (117.6 mM NaCl, 5.4 mM KCl, 0.82 mM $MgSO_4$, 1.5 mM KH_2PO_4 ,

20 mM HEPES, 9 mM NaHCO₃, 0.1% w/v HSA, and 2.25 mM CaCl₂, pH 7.4 at 37°C) and incubated in 100 µL buffer A containing 15 mM glucose and increasing concentrations of the test compound, such as for instance 1, 5, 10, 25, 50 or 100 µM, for 180 minutes. Glycogen content was measured using standard procedures

5 (Agius, L. et al, *Biochem J.* **266**, 91-102 (1990)). A compound, which when used in this assay gives a significant increase in glycogen content compared to the result from the assay without compound, was deemed to have activity in this assay.

[00160]Glucokinase Activity Assay (III)

10 **[00161]Stimulation of insulin secretion by glucokinase activators in INS-1E cells**

[00162]The glucose responsive β-cell line INS-1E was cultivated as described by Asfari M et al., *Endocrinology*, **130**, 167-178 (1992). The cells were then seeded into 96 well cell culture plates and grown to a density of approximately 5 x 10⁴ per well. Stimulation of glucose dependent insulin secretion was tested by incubation

15 for 2 hours in Krebs Ringer Hepes buffer at glucose concentrations from 2.5 to 15 mM with or without addition of glucokinase activating compounds in concentrations of for instance 1, 5, 10, 25, 50 or 100 µM, and the supernatants were collected for measurements of insulin concentrations by ELISA (n= 4). A compound, which when used in this assay gives a significant increase in insulin secretion in response

20 to glucose compared to the result from the assay without compound, was deemed to have activity in this assay.

INTERNATIONAL SEARCH REPORTInternational application No.
PCT/EP2005/056473**Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 23 and 24 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.
